

# MECCANO

## Tendeur de Courroie

La poulie de 18 mm (1) montée sur la tringle (2) est entraînée à l'aide d'une courroie par l'autre poulie de 18 mm fixée sur l'arbre du moteur. — entraînée par ce dernier à l'aide d'un système d'engrenages.

La tringle (2) est montée sur 2 bandes de 5 trous étendues l'une à l'autre par un boulon de 18 mm (3) et elle porte le pignon de 14 dents (4). Les bandes de 5 trous pivotent librement sur l'arbre du moteur (5) qui porte une courroie (6) de 14 dents qui engraine avec le pignon (4). La course des bandes de 5 trous est limitée par le boulon (7).

Quand le mécanisme fonctionne, le mouvement est transmis de la tringle (2) à la tringle (8) par le pignon (4) et la roue dentée (6), mais en même temps, le pignon a tendance à tourner autour de la roue dentée, entraînant avec lui les bandes de 5 trous et la poulie (1). — tendant ainsi la courroie. Ce fait s'explique à mesure que la charge augmente.
